RF-10e Release Notes

Version 1.06.1

28.04.2026

New Functionality

- The generation of a diagnostic report can now be triggered via the LCD menu (e. g. for maintenance by a site technician, who has no access to the web interface and who might needs to restart the device because of a problem. In such cases a diagnostic report is often helpful for us, but it needs to be generated before the reboot)
- Settings stored on the device can now also be activated via the LCD menu

Fixed Issues

- The NMOS device ID wasn't static and changed after reboots of the device or NMOS restarts
- The SDP files and the SDP information exposed via NMOS didn't match regarding the stream names
