X-4s / X-4sd Release Candidate Notes

Version 1.16-rc1

18.12.2024

Fixed Issues

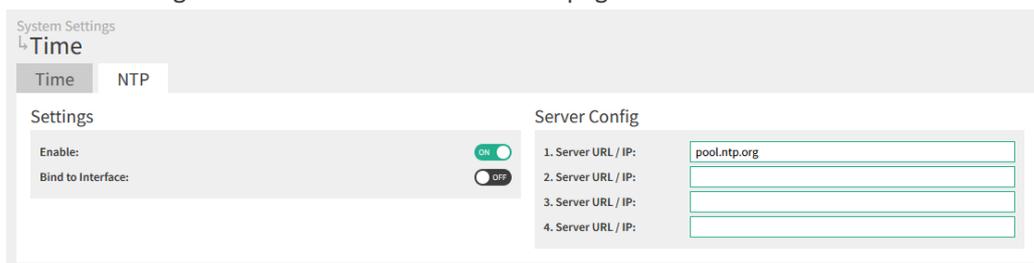

- SNMP traps: Due to invalid OIDs in the SNMP MIB, some traps could not be assigned correctly

Changed functionality

- The list of present and missing licenses/rights on the System Settings / Global page is now presented in a clearer fashion

- The NTP settings have been moved to the 'Time' page

- The NTP functionality has been completely revised. This eliminates the update interval and now allows 4 NTP servers to be configured. Furthermore, a status/time page is now available that displays the status of the NTP servers.
- The menu of the web interface does now collapse to a hamburger menu in case screen width is limited

New Functionality

- Added new crash report functionality

In case the device does crash (performing an unintended reboot) it was until now very difficult to find the root cause for the crash/reboot. In such a case a crash report will now be generated which should be sent to us via the 2wcom Support Center. It will allow us to inspect the reason for the crash/reboot, enabling us to develop a fix for the crash.

The crash report can be downloaded via System Settings / Global:

X-4s / X-4sd Release Candidate Notes

- The rudimentary wait page shown when e. g. doing a firmware update or rebooting the device is replaced by a prettier dialog
