Version 1.08

14.01.2026

New functionality

- Support for devices with single HSPS

Changed functionality

- Dual power supply: If only one of the supplies is being used, the power LED flashes red/green. This can now be prevented by activating ONE supply alarm. Selecting only ONE PSU alarm signals that the second supply is not being used, which is why the power LED lights up green.

Version 1.07

16.11.2023 – updated: 25.02.2026

Changed functionality

- Power LED extended by two-stage error status.
  Color states:
  - Green -> Supply(s) ok, fan ok
  - Red/Green 1Hz flashing: Fan or supply warning
  - Red/Green 2Hz flashing: Fan and supply warning (new)
    Notes:
    - Further states are possible when starting or updating the device
    - For example, 1Hz flashing means a colour change every 500ms
- Hot swappable supply indicates a fan fault with a red/green LED flashing

New Functionality

- If a device restart is triggered by the watchdog, this is now logged and can be displayed in the log.

Fixed Issues

- Fan monitoring rates fan incorrectly
